

Token Decimals

Guidelines:

Token decimals is a list of tokens addresses and decimal places. It's purpose is to provide the number of decimal places used by tokens that throw an error if the `decimals` function of its contract is called.

Examples of rejection reasons are given in italic.

Reject a submission if:

- The address does not belong to a token in the same chain of this list.
- There is an accepted item for this address (i.e. no duplicates are allowed).
- The number of decimal places is wrong.

Accept all submissions otherwise.
